

Major: Chemical Engineering

Academic Qualifications

Year	Educational Qualification	Institute	CPI/%
2021 - 2025	Bachelor of Technology	Indian Institute of Technology, Kanpur	8.3/10.0
2021	Class XII (CBSE)	GVN The Global School, Bhopal	95.2%
2019	Class X (CBSE)	Delhi Public School, Bhopal	97.0%

Work Experience

Meesho | Senior Associate

(Jun'25 - present)

POD Lead - Resurrection

(Nov'25 - present)

Objective	- Drive GMV incrementality through re-activation of non-transacted users in the past ≥ 180 days (180D+ 0I) - Structure & tinker the remarketing (RMK) effort for the re-acquisition strategy of this ~75M Resurrection Base
Approach	- Re-structured the existing model based on user cohortisation at App Inactivity (AI) to AI X Install_Status level - Hypothesized the new structure basis observation of targeting & spending inefficiencies in existing structure - Pivoted from Platform 1oD+ BAU RMK optimizations to First Order optimizations for uninstalled userbase - Experimented and proved GMV incrementality on ~30M userbase, further-on scaled it to the entire ~75M Base - Identified the most incremental Region X Gender cohorts in RCS & IVR campaigns executed during Sale days - Scaled IVR campaigns on Female MAU Base, with incrementality holding beyond first week post Sale (baseline)
Impact	- Delivered 5% GMV/E uptick in new structure vis-à-vis old structure, resulted in 0.15% Platform GMV/Vi uptick - Achieved a 50% lower incremental CAC on Sale Days by incorporating IVR campaigns supplemented with RMK

Google & Meta led Remarketing POD

(Nov'25 - present)

Objective	- Drive NMV incrementality, 1st Order activations (1oA) uplift by introducing Google Ads as an RMK channel - Maintain & boost DAU/E, GMV/E uplifts from Meta RMK BAU effort while improving Internal Rate of Return(IRR)
Approach	- Formulated the experimentation structure for Google RMK by cohortisation; aligned it with Meta RMK BAU - Launched 20+ experiments to figure out the optimum Burn/E X Campaign Type X Google/Meta Spends X cohort - Scaled Google RMK on 2 cohorts (30M users), created further sub-cohorts based on DAU/ X Conversion insights - Observed 5% GMV/E uptick in 1 sub-cohort (platform userbase of 60M) at experimentation stage on 6M users - Identified Meta RMK opportunities for Sale Days, launched 3 booster campaigns on combined userbase of 150M
Impact	- Delivered 0.10% Platform GMV/Vi uplift by scaling Google RMK on 30M users, while meeting IRR guardrails - Achieved 1% GMV/E uptick for 150M userbase through combination of Meta RMK boosters on Sale Days

Homepage POD

(Jun'25 - Nov'25)

Objective	- Drive NMV incrementality by optimizing FY Feed, supplemented with increased retention (DAU/MAU) metrics - Boost feed performance through rankers; capture seasonal trends and serve user relevant trend X catalogs
Approach	- Served catalogs in FY Feed through bifurcation into a variety of explore & exploit CGs based on past user intent - Built 2 layer ranker stack-first having explore & exploit CG ranker; second predicting explore/exploit at App Open - Defined user, cohort, platform and momentum ranker features directly aligned with CG level use-cases & nuances - Created a 3 stage cohort-based trend identification pipeline; trend identification via PST spike (3 DMA/30DMA) - Integrated & tuned LLMs to map PSTs to seasonal themes, followed by relevance check to filter out random noise - Generated optimized theme X catalog matrix; user X theme boosting/deboosting using CTR based Wilson score
Impact	- Delivered 1.5% NMV/Vi uplift through Exploit Ranker at experimental level; scaled to the entire platform - Achieved 0.3% NMV/Vi uplift at 20% platform exposure through Seasonal CG, captured 95% of local trends

Research Internships

Dr Reddy's Laboratories | Young Leaders' Program Technical Intern

(May'24-Jul'24)

Objective	Reduce functional coating time of Pantoprazole 40mg DR tablets, spanning 25 hours in the manufacturing plant
Approach	- Segmented 12K+ parameter-weight gain-time datapoints to characterise 70+ environments in pan coater - Constructed a 21.25 hour optimal pathway by generating environments which maximise coating at each minute - Validation through examination of 150+ parameter-weight gain-time harmonisations of result & source data
Impact	- Saved 3.5 hrs- total 14.2% time reduction achieved through time-logged optimal pathway of process parameters - Fulfilled acceptance criteria of 4 Critical Process Parameters (CPPs), equipped operator with a 3 faceted guide

Surfactant Property Prediction & De-Novo Design using Transformers | UG Project, IIT Kanpur

(Aug'24 - Dec'24)

Objective	Leverage transformer-based models to generate optimized surfactants & predict logCMC using SMILES strings
Approach	- Curated source data of 427 surfactants with logCMC; preprocessed using tokenization, normalization & encoding - Trained generative model on 90,951 molecule pairs; accomplished L1 & L3 levels of transformer integration
Impact	Achieved R² = 0.76, RMSE = 0.23 on logCMC prediction; validated clustering via t-SNE & enabled de-novo design

Skills

- Product Management:** Product Thinking, A/B Testing, Root Cause Analysis (RCA), Product Design, SQL
- Programming:** C, C++, Python | **Libraries:** Numpy, Pandas, Matplotlib, Scikit-learn, TensorFlow | **Misc:** Excel, Latex
